

AI-Powered Scam Website Detection System

Abstract

Online fraud and phishing websites have become a major concern for internet users. This project proposes a web-based application that helps users verify whether a website is safe before visiting it. The system analyzes a website's URL and basic security indicators such as HTTPS availability, suspicious patterns, and domain information to generate a trust score. The application presents the results in a simple and understandable format, enabling users to identify potentially unsafe websites and browse more securely.

Key Features

- URL validation and scanning
- Website trust score
- Detection of suspicious URL patterns
- Simple security report
- Search history of scanned websites
- Responsive user interface

Technologies Used

HTML, CSS, JavaScript, Node.js, Express.js, MongoDB, Gemini API (optional)

Smart Study Assistant with AI

Abstract

Students often spend considerable time preparing notes and revising study materials. This project provides a web application that allows students to upload study documents and receive organized summaries, practice questions, and revision materials. The system is designed to simplify exam preparation by presenting important information in a structured manner while keeping the interface easy to use.

Key Features

- Upload PDF study materials
- Automatic summary generation
- Practice quizzes
- Flashcards for revision
- Topic-wise organization
- Student dashboard

Technologies Used

HTML, CSS, JavaScript, Node.js, Express.js, MongoDB, Gemini API

Smart Lost and Found Management System

Abstract

Managing lost and found items in colleges is often done manually, making the process slow and inefficient. This project introduces a centralized platform where students can report lost or found belongings along with descriptions and images. The system helps users search records, compare item details, and notify them when a possible match is identified, improving the chances of recovering lost items.

Key Features

- Report lost items
- Report found items
- Image upload support
- Search and filter records
- Suggested item matching
- Administrator dashboard

Technologies Used

HTML, CSS, JavaScript, Node.js, Express.js, MongoDB, Cloudinary/Firebase Storage
